SACCHAROMYCES Pitch Rates

There are many schools of thought on pitch rates:

1. One rule of thumb is to pitch 1 million cells per mL per degree Plato for ales. By applying this rule, for example, a 16 Plato (1.065 specific gravity) wort would be pitched at a rate of 16 million cells per mL.

2. Another rule of thumb includes pitching 0.75 million cells/mL per degree Plato for ales under 1.065 specific gravity (twice that rate, i.e., 1.5 million cells/mL per degree Plato for lagers) and 1.5

million cells/mL per degree Plato for ales over 16 Plato. Applying this rule, for instance, would result in an ale yeast pitch rate of 9 million cells/mL for a 12 Plato (1.048 specific gravity) wort.

3. Generally, a pitch rate of 7 million cells/mL should be adequate for ales under 1.060 (15 Plato).

If you have questions about recommended pitch rates or would like a quote for a pitch rate quantity not shown on the chart, please [contact us](#).

BRETTANOMYCES Pitch Rates & Pricing

We recommend a pitch rate 500,000 cells/mL for a secondary pitch of Brett.

	Number of Barrels															
	1	2	3	4	5	6	7	8	9	10	15	20	30	40	50	60

LACTOBACILLUS Pitch Rates & Pricing

We recommend 1L of Lacto Blend to direct pitch 3bbls of wort for most kettle sours. If pitched at 95F, pH is roughly at 3.2-3.4 within 18-24 hours. Do not let temperature rise above 100F and use unhopped wort because the Lacto is extremely sensitive to hops.

All bacterial cultures, including the Lacto Blend, are \$82 per liter.
